$$L.S. \left[\left(\frac{x_{max}}{2} - x_2 \right) \cdot \eta + x_2 \right] \quad \text{if } \frac{x_{max}}{2} > x_2 \quad \text{else } \frac{x_{max}}{2}$$

$$L.S. \left[\left(-\frac{x_{max}}{2} - x_1 \right) \cdot \eta + x_1 \right] \quad \text{if } -\frac{x_{max}}{2} < x_1 \quad \text{else } -\frac{x_{max}}{2}$$

I implemented this into the current code. The user can specify the monitor sizes by a ratio of the cell size in each direction. This should drastically reduce needed memory w/out compromising ~~to~~ quality of saved data.
